# Different RFID Technologies

# RFID System Categorization

RFID Systems Can  
Be Categorized  
Based on

*Mode of  
Operation*

**Full / Half  
Duplex**

**Sequential**

*Transponder  
Formats*

**Chip /  
Chipless**

**Active /  
Passive**

*Frequency,  
Range,  
Coupling*

**LF / HF /  
UHF /SHF**

**Short / Long  
Range**

**Magnetic /  
Electrical  
Coupling**

# Inductive Coupling RFID Systems

The inductive coupling RFID system is widely used in today's market and it has the following properties:

- ❖ Frequency of Operation: Such as 13.56 MHz
- ❖ Coupling: Inductive Coupling (Magnetic Coupling)
- ❖ Range: Short Range ( $\leq 1$  m)
- ❖ Passive Tags (energized by the reader)
- ❖ Tag with Chip (the tags has an ASIC)

Proximity Smart Cards (13.56 MHz)  
Range = 4 inches (10 centimeter)  
ISO 14443

Vicinity Smart Cards (13.56 MHz)  
Range = 3 feet (1 meter)  
ISO 15693

<https://www.google.com/Images>

# Near Field Communication (NFC)

NFC Forum, was founded in 2004 by Nokia, Philips Semiconductors (became NXP Semiconductors since 2006) and Sony.

It's a short-range, low power wireless link based on inductive coupling RFID tech that can transfer small amounts of data between two devices held a few centimeters from each other.

Used in smartphones and it is less complex compared to Bluetooth and WiFi technologies

Modes of Operations

NFC Applications

# Passive UHF RFID System Operation

The reader transmits modulated signal with periods of un-modulated carrier

The RF voltage developed on the tag antenna terminals during un-modulated period is converted to dc, this voltage powers up the chip .

The chip sends back the information by changing its impedance between 2 different states, effectively modulating the back-scattered signal.

# Passive UHF RFID Data Exchange

Data exchange between an RFID reader and a tag

<https://www.google.com/Images>

# Passive UHF RFID vs. Barcode

Property	UHF RFID	Barcode
Scanning	Simultaneous	Sequential
Read Rate	1200 Tag/sec	1 Tag/sec
Communication	Non-line of sight	Line of sight
Temperature threshold	Higher/Lower	Less tolerant
Read Accuracy	98%	80%
Data	Storage and Processing	None
Sensors	Any	None

# Let's See a Demo

# UHF RFID Read Range and Limitations

## Tag Limitations

Read range which can be calculated using Friis free space formula as:

$$r = \frac{\lambda}{4\pi} \sqrt{\frac{P_t G_t(\theta, \phi) G_r(\theta', \phi') p |T_{tag}|^2}{P_{th}}} \quad \text{and} \quad |T_{tag}|^2 = 1 - |\Gamma_{tag}|^2$$

$P_t G_t$  ?

$P_{th}$  ?

For  $r_{max}$

# Other Identification Technologies

# Other Identification Technologies

Do Other Identification Technologies Exist?

Yes for sure, technologies evolve rapidly here are examples for technologies that can be used for identifications .

**Bluetooth®**

**ZigBee®**

BLUETOOTH LOW ENERGY

**ThingMagic**  
A DIVISION OF TRIMBLE

<https://www.google.com/Images>

# WiFi for Identification (Wi-Fi ID)

Wi-Fi ID is technically an active RFID system that uses the 802.11 standard of air communication in the 2.45GHz frequency spectrum.

Does not need any special hardware or firmware modifications required. Can easily co-exist with Wi-Fi clients such as laptops

To determine location: Radio Signal Strength Information (RSSI) and Time Difference Of Arrival (TDOA) can be used.

Things to be aware of:

- 1- Network Traffic and Network Null spots
- 2- Battery life
- 3- Tag Cost (\$35-\$50)

<http://rfid.net/basics/rtls/123-wi-fi-how-it-works>

# Bluetooth Low Energy (BLE)

BLE implements an entirely new protocol stack along with new profiles and applications. Its core objective is to run for a very long time on a coin-cell battery

BLE was defined as part of the most recent standard specification Bluetooth v4.0.

Operates in the 2.4GHz ISM band with only 40 channels spaced 2MHz apart. BLE also is known as Bluetooth Smart

It is capable of transmitting at a rate of 1Mbit/s. Other BLE features include a 0-dBm (1 mW) power output and a typical maximum range of 50 meters.

<http://rfid.net/basics/rtls/123-wi-fi-how-it-works>

<http://electronicdesign.com/mobile/what-s-difference-between-bluetooth-low-energy-and-ant>

# ZigBee

Based on IEEE 802.15.4 Standard. It was introduced by ZigBee alliance in 2003.

Frequency and data rates: 868 MHz / 20 kb/s; 915 MHz / 40kb/s; 2.45 GHz 250 kb/s .

Utilizes Mesh, Star, and Tree Networking. Standard specifies that each device shall be capable of transmitting at least 1 mW.

Typical devices (1mW) are expected to cover a 10-20 m range  
Standard requires a receiver sensitivity of -85 dBm.

**ZigBee®**

<http://www.cse.yorku.ca/~dusan/Zigbee-Standard-Talk.pdf>

# ANT/ANT+

ANT is a Proprietary wireless network protocol and RF solution designed for use in ultra-low power PANs and WSN applications.

Designed for operation in the 2.4 GHz frequency band. ANT powered network nodes can operate for years

transmission modes up to a net data rate of 20 kbit/s. Ant's over the air data rate is 1 Mbit/s for low duty cycle operation. With range of 10-30 m.

Typical ANT applications: Heart rate monitors, Speed and distance monitors, Weight scales for the measuring of BMI ,Temperature sensors, etc.

<https://www.arrow.nac.com/solutions-applications/machine-to-machine/files/atd-ant.pdf>

# Visible Light Communication (VLC)

VLC enables Internet service to be delivered over your home lighting system, and traffic lights to communicate road conditions to your automobile Based on IEEE 802.15.7 Standard.

In order to transmit data over light, the light source is pulsed on and off rapidly to create a data stream. Optical receivers convert the light pulses to an electronic signal.

**How is this related to Identification?**

It is used nowadays in indoor localization which is consider an identification process

[https://ctc.unc.edu/documents/techbriefs/200911\\_vlc.pdf](https://ctc.unc.edu/documents/techbriefs/200911_vlc.pdf)

- Different RFID Technologies
- UHF RFID and its Applications
- Other Identification Technologies
- UHF RFID Future

# Future Trends

# What Are the Current Barriers

Before looking forward for the future we should ask ourselves about the current barriers for UHF RFID?

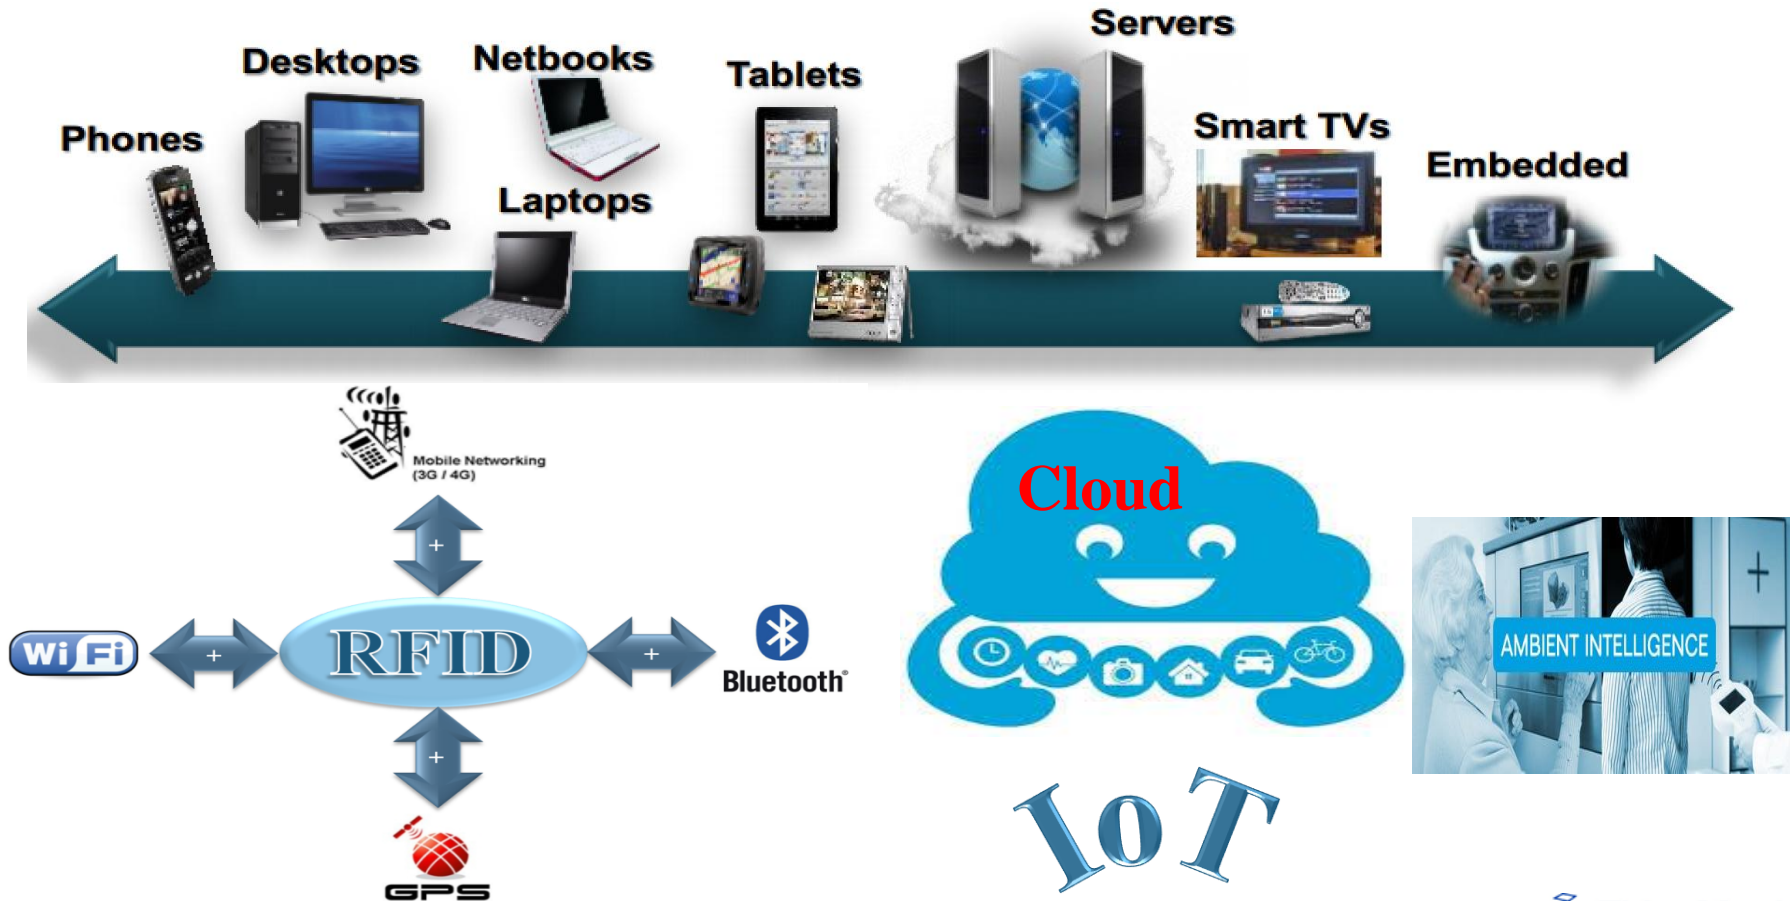

- 1-Infrastructure needed.
- 2-Physical Limitations.
- 3-Security Issues.
- 4-Privacy Concerns.
- 5-Already Existing Identification Technologies.
- 6-Cost.
- 7- Standardization.

Can such Barriers be overcome?

<https://www.google.com/Images>

# UHF RFID Integration

We should think of UHF RFID as one part of different technologies integration rather than standalone technology.

[http://www.rfidjournal.net/masterPresentations/rfid\\_hightech2012/np/diorio\\_1100\\_oct11.pdf](http://www.rfidjournal.net/masterPresentations/rfid_hightech2012/np/diorio_1100_oct11.pdf)

# Wireless Sensors

RFID tags can have sensors capabilities for measuring different physical properties.

Capacitive Touch Sensor Tag

WISP: A Passively Powered RFID Tag with Sensing and Computation

Temperature Sensor Tags

Passive Sensor for Cracks detection

Strain Sensors Tag

Gas Sensor Tag

# Body Area Network (BAN)

In December 2011, the IEEE 802.15.6 a draft of a standard for BAN technologies was approved.

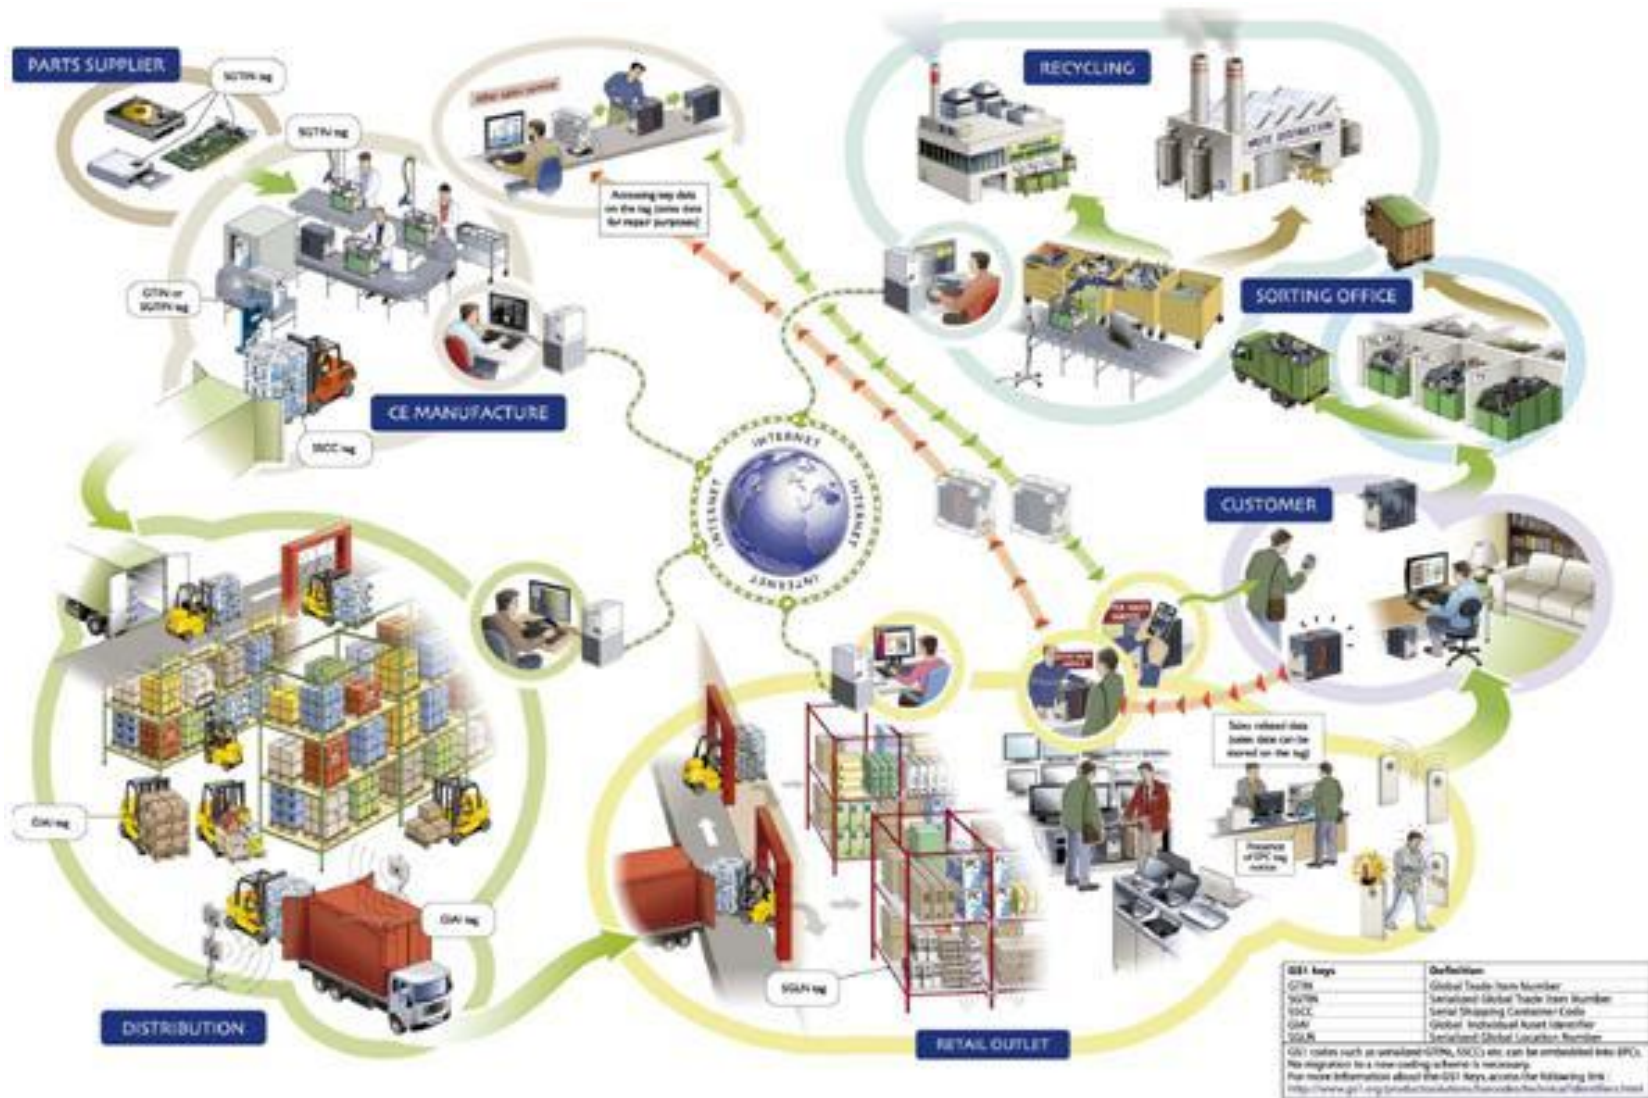

Low-power and short-range wireless to be optimized for devices and operation on, in, or around the human body.

*Thank you for Listening*  
*Any Questions??*

# Appendix

# NFC Modes of Operation

Active Mode

Passive Mode - Reader Emulation

Passive Mode - Card Emulation

## Active Mode

-At first one of the NFC interfaces activates its transmitter and thus works as the NFC initiator.

- The transmission direction is reversed in order to send data from the NFC target to the NFC initiator.

## Passive Mode

-An NFC interface with weak power supply, can negotiate and adopt the role of the NFC target in order to save power.

-Established for compatibility with passive transponder

M: Number of subcarrier cycles per symbol	Modulation type	Data rate (kbps)
1	FMO baseband	BLF
2	Miller subcarrier	BLF/2
4	Miller subcarrier	BLF/4
8	Miller subcarrier	BLF/8

[http://www.gs1.org/gsm/gk/epcglobal/uhfclg2/uhfclg2\\_1\\_2\\_0-standard-20080511.pdf](http://www.gs1.org/gsm/gk/epcglobal/uhfclg2/uhfclg2_1_2_0-standard-20080511.pdf)

# T->R Communication – Continued

## Memory Banks

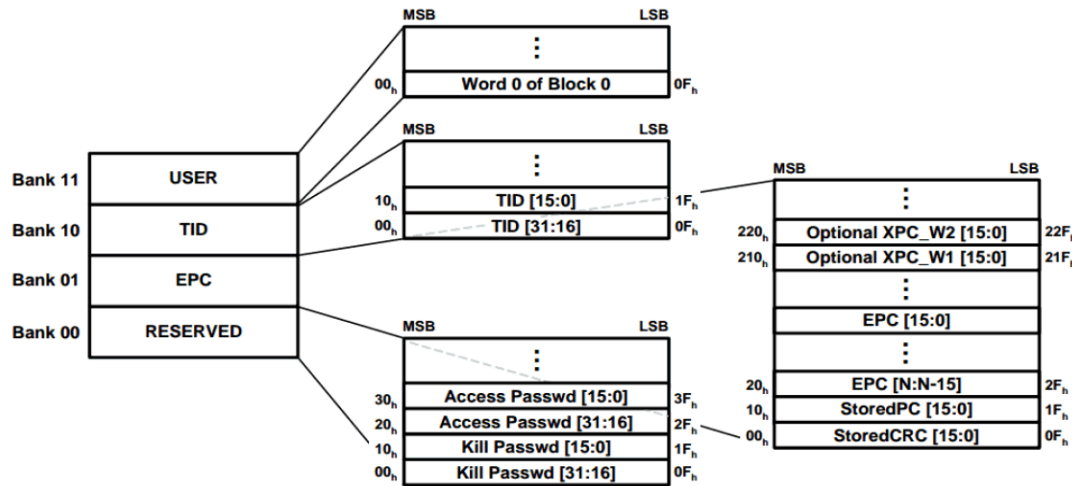

Figure 6.17 – Logical memory map

Reserved memory: contain the kill and and/or access passwords, if passwords are implemented on the Tag.

EPC memory: contain a StoredCRC at memory and EPC that identifies the object to which the Tag is or will be attached.

TID memory: contain an 8-bit ISO/IEC 15963 allocation class identifier, TID memory shall contain sufficient identifying information for an Interrogator to uniquely identify the custom commands and/or optional features that a Tag supports.

User memory is optional.

# Gen2 Protocol Collision Handling

## Random-slotted Collision Arbitration:

- Tags load a random (or pseudo-random) number into a slot counter, decrement this slot counter based on Interrogator commands, and reply to the Interrogator when their slot counter reaches zero.
- Q : A parameter that reader uses to regulate the probability of Tag response.
- Reader commands Tags in an inventory round to load a Q-bit random (or pseudo-random) number into their slot counter.
- Tags reply when the value in their slot counter is zero.
- Q is an integer in the range (0,15); the corresponding Tag response probabilities range from  $2^0 = 1$  to  $2^{15} = 0.000031$ .

[http://www.gs1.org/gsmp/kc/epcglobal/uhfclg2/uhfclg2\\_1\\_2\\_0-standard-20080511.pdf](http://www.gs1.org/gsmp/kc/epcglobal/uhfclg2/uhfclg2_1_2_0-standard-20080511.pdf)

# Can UHF RFID be used as NFC?

## Near Field vs. Far Field

Based on the antenna dimension and frequency of operation the space around the antenna can be divided in two main regions : Near Field and Far Field.

Property	Near Field	Far Field
Range	< 1 meter	> 1 meter
Power Transfer to Tag	High Power	Low Power
Security	Highly Secure	Less Secure
Cost	Less	More

<http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.230.194&rep=rep1&type=pdf>

# UHF RFID As Near Field Application

## Near Field vs. Far Field

- Reduce the power of the reader. [Reader Side]
- Shorter range tag. [Tag Side]
- Use near field UHF RFID antenna.

Cheaper, lower power UHF RFID should be designed and this should push the market toward new trend to replace the NFC.

<http://www.hindawi.com/journals/ijap/2013/961042/>

# Garment Management

## ThingMagic - Disney Case Study

Tracking \$100 million worth of costumes (3 million garments) at parks and on cruise ships

RFID-based garment management solution used at 25 costume storage areas and 40 issue counters; Processing 23,000 costumes check-outs daily

### Benefits:

- Inventory counting times reduced from 180 labor hours to two labor hours
- Increased inventory accuracy to nearly 100 percent

### ROI:

Cost savings of more than \$1 million and ROI in less than a year

A DIVISION OF TRIMBLE

# Ford Motor Company

- HAVE THE RIGHT TOOLS WHEN AND WHERE YOU NEED THEM
- RFID (RADIO FREQUENCY ID) INVENTORIES TAGGED ITEMS
- CREATE TOOL INVENTORIES BASED ON JOB REQUIREMENTS
- HELP REDUCE TOOL LOSS AND PREVENT REPLACEMENT COSTS

## MISSING ANYTHING? NOW YOU'LL KNOW.

Ford Work Solutions™ Tool Link™ from DEWALT uses RFID technology to tell you what's in your truck and what isn't. Check Tool Link before you leave for a job to make sure you have the tools you need. Check it again at the end of the workday to see that all the gear you used at the job site is back on board. Simply attach the included RFID tags to any tools or equipment you want to track. Place the tools in the truck or van and use the Tool Link system to scan them. The system identifies each

tag, and you can type in the name of the item. Once the inventory is complete, the system can track the items you tagged whenever they're in the truck, and alert you if they're missing. You can add new items to an existing inventory, and even create job-specific inventories. Off the job, use Tool Link to track the stuff you use for camping, hunting or for your favorite hobby. Whether it's tracking a compressor or a tackle box, Tool Link is one seriously useful piece of technology.

*ThingMagic In-Vehicle Readers for Ford's 2009 F- & E-Series trucks and vans, 2010 TransitConnect*

# Modes of Operations

*Full-Duplex (FDX):* the data transfer from the tag to the reader takes place at the same time as the data transfer from the reader to the tag.

*Half-Duplex (HDX):* the data transfer from the tag to the reader alternates with data transfer from the reader to the tag.

*Sequential (SEQ):* the transfer of energy from the transponder to the reader takes place for a limited period of time only.

*FDX:* tag transmit at different frequency from reader.

*HDX & FDX:* Reader transmit energy all the time.

Reader to Tag (Downlink), Tag to Reader (Uplink).

Klaus Finkenzeller "RFID Handbook: Fundamentals and Applications in Contactless Smart Cards, Radio Frequency Identification and Near-Field Communication", Edition 3, Wiley 2010.

# Transponder Formats

*Chip vs. Chipless Tags:* Some tags has Application-specific integrated circuit (ASIC) chip to store tag data, while others tags are chipless.

*Active vs. Passive Tags:* Active tags have there own power source (battery), while passive tags are energized by the reader (battery-less).

*Semi-passive tags:* these tags have a power source (battery) which are only activated when the tags is in the field of a reader.

Chipless Tags

# Custom Commands

A tag might have to respond fast to set an alarm

Tag Data should be invisible to unauthorized reader

Data Should be loaded to tag as fast as possible.

- Read Protect
- EAS Alarm

- QT Read/Write

- Load Image
- Block Read Lock

**And More ..**

[http://www.gs1.org/gsm/kc/epcglobal/uhfc1g2/uhfc1g2\\_1\\_2\\_0-standard-20080511.pdf](http://www.gs1.org/gsm/kc/epcglobal/uhfc1g2/uhfc1g2_1_2_0-standard-20080511.pdf)

# Inductive Coupling Operation Overview

1. Reader's antenna coil generates a strong, high-frequency electromagnetic field that is magnetically coupled with the tag antenna coil.
2. The coupled reactive near-field energy is used by the tag to power up the Chip
3. The tag modulate back the signal through load modulation.

Klaus Finkenzeller "RFID Handbook: Fundamentals and Applications in Contactless Smart Cards, Radio Frequency Identification and Near-Field Communication", Edition 3, Wiley 2010.

Frequency Domain Signal

Time Domain Signal

Tag signal  $\ll$  the reader signal

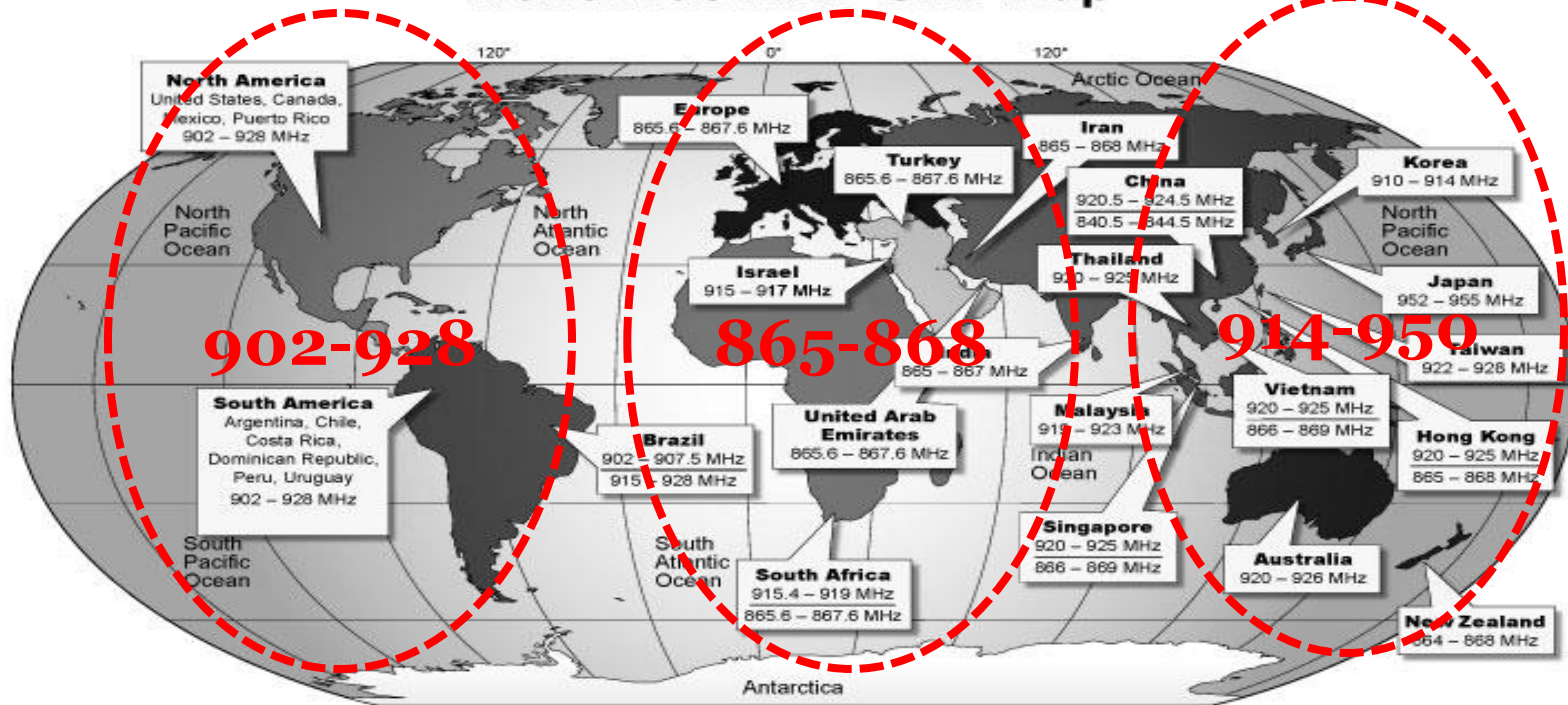

Load resistor in the transponder is switched on and off at a very high elementary frequency  $f_S$

Using BPF the tag signal can be easily separated, usually  $f_S$  varies based on the protocol.

# RFID Regulations

- Each country has its own organization that regulates the use of communication systems.
- This organization regulates the frequency band to be used and the maximum allowed power, spectrum mask, etc.
- Moreover, it regulates the unintentional radiations level outside the assigned bands to reduce the interference.

# UHF RFID Regulation Specifications

➤ As an example let's see the ETSI EN 302 208-1 V1.4.1

Figure 1: Diagram of channel plan

NOTE: Where  $f_c$  is the centre frequency of the carrier transmitted by the interrogator.

Figure 3: Spectrum mask for modulated signals

Legend: LT: Limited tests, see clause 3.1.  
FT: Full tests, see clause 3.1.

Figure 2: Tests on a single sample for equipment within the band 865,0 MHz to 868,0 MHz

Table 4: Spurious emission limits in e.r.p.

State	47 MHz to 74 MHz 87,5 MHz to 118 MHz 174 MHz to 230 MHz 470 MHz to 862 MHz	Other frequencies below 1 000 MHz	Frequencies above 1 000 MHz
Operating	4 nW (-54 dBm)	250 nW (-36 dBm)	1 $\mu$ W (-30 dBm)
Standby	2 nW (-57 dBm)	2 nW (-57 dBm)	20 nW (-47 dBm)

Figure 5: Repeated transmissions on the same channel

$A \leq 4$  s;  $B \geq 100$  ms.

Max.  $T_x$  Power = 2 W  
Extreme Conditions

# UHF RFID Protocols

- Most of the communication systems parameters are defined by different communication protocols.
- These communication protocols define the physical layer parameters such as: modulation, encoding, data rates, signaling, timing, etc. for both the reader and the tag.
- These protocols facilities the standardization of UHF RFID products from different manufacturers.

International  
Organization for  
Standardization

# EPC Class-1 Generation-2 v 1.2.0

## Reader-to-Tag (R->T) Communication

Modulation: DSB-ASK,  
SSB-ASK, or PR-ASK

Data Encoding: PIE

R=>T RF envelope, Power-up  
& down waveform.

Transmit mask

Preamble and Frame-sync

Collision Handling

## Tag-to-Reader (T->R) Communication

Modulation: ASK and /or  
PSK

Data Encoding: FMO and  
Miller

Tari 6.25 $\mu$ s to 25 $\mu$ s

Backscattering Link  
Frequency (BLF) 40 to 640  
kHz

Memory Banks

# Low Level Reader Protocol (LLRP)

Ratified by EPCGlobal in April 2007

Protocol that is intended to standardize the network interface of the RFID readers.

It is designed as a standard in order for developers to have a common programmatic interface to RFID readers from different manufacturers.

# UHF RFID Reader Features

Here is a list of important feature of UHF RFID Readers

**Sensitivity**

**Protocol  
Compliance**

**Regulation  
Compliance**

**Read Rate**

**Collision  
Detection**

**Adaptation  
with Tag  
Population**

**Power  
Consumption**

**Durability**

**Configurability**

**And More**

# UHF RFID Tag Features

Here is a list of important feature of UHF RFID Tags

**Threshold  
Power**

**Orientation  
Sensitivity**

**Protocol  
Compliance**

**Security  
Measures**

**User  
Memory  
Storage**

**Custom  
Commands**

**Material  
Mounting**

**Passive or  
Battery  
Assisted**

**Sensors**

**And More**
